

We start by loading the RS module code.

```
>>> import RS
```

Now we can start invoking R functions. We first do a simple one with a single argument.

```
RS.call("plot", [1,2,3])
```

You should see a plot appear in a separate window.

```
>> args = {'pch' : "+", 'id': 100};  
>> RS.namedCall("foo", args)
```
